Demand Management

Standby Generation Demand Response

DRPro Knowledge Application

DRPro is a complete end-to-end solution for managing embedded generation.

DEMAND RESPONSE MANAGEMENT MADE EASY Standby Generation Demand Response Solutions

DRPro can integrate and manage standby generators, renewables, micro grids and storage in a way that is beneficial to both customers and utilities.

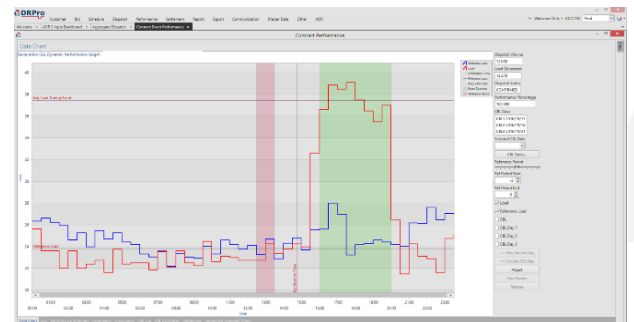

DRPro manages the customer's contract and availability/scheduling on a daily basis. DRPro aggregates the customer's information into 'units' to ensure the utility/system operator interacts with a demand response product, instead of many individual customers.

Typically, a standby generation demand response customer is provided with a few hours' notice via automated signal, telephone, sms or e-mail to start generating, or this can be automated.

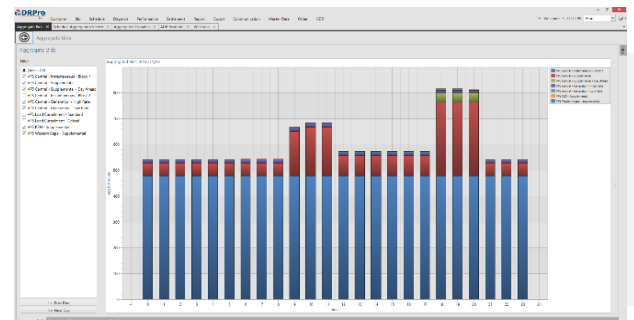

When the utility/system operator requires customers to be dispatched, they contact the DRPro Operations Desk. DRPro dispatches the customers, then collects metering information, calculates performance, and reports on financial settlements/incentives payable.

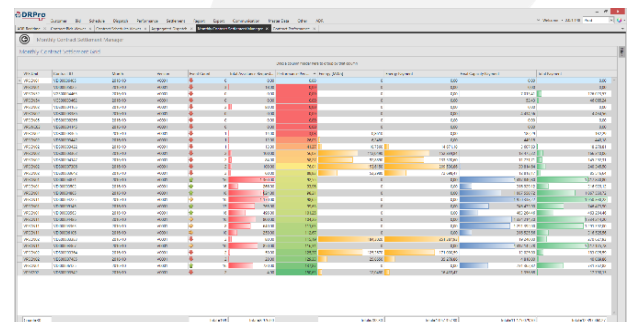

Standby Generation demand response is a key tool for a utility or system operator, to get assistance when it's needed most.
