

# Self Generation Demand Response

DRPro KNOWLEDGE APPLICATION

DEMAND RESPONSE SOLUTIONS  
Demand Management

*DRPro is a complete end-to-end solution for managing embedded generation.*

## DEMAND RESPONSE MANAGEMENT MADE EASY

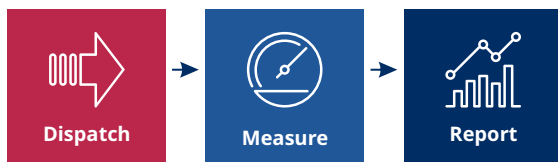

DRPro can integrate and manage standby generators, renewables, micro grids and storage in a way that is beneficial to both load providers and utilities.

DRPro manages the load providers' contracts and availability/scheduling on a daily basis. DRPro aggregates the load providers' information into 'units' to ensure the system operator/utility interacts with a demand response product, instead of many individual load providers.

Typically, a self generation demand response load provider is given a few hours' notice via automated signal, telephone, SMS or e-mail to start generating, or this can be automated.

When the system operator/utility requires load providers to be dispatched, it contacts the DRPro Operations Desk. DRPro dispatches the load providers, then collects metering information, calculates performance, and reports on financial settlements/incentives payable.

**Self Generation demand response is a key tool for a system operator/utility to get assistance when it's needed most.**

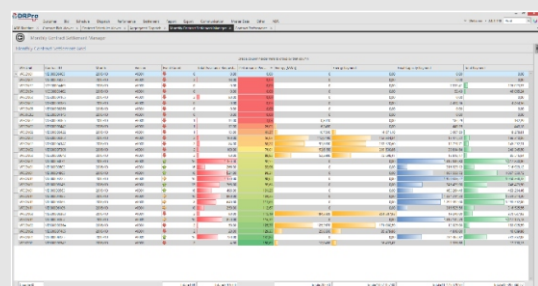

**Quick – Easy – Auditable**

**Event information at a glance**

**Portfolio availability dashboard**

**Portfolio performance information**
